

# Avalanche danger

Forecast through: 11.5.2025, 17:00 / Next update: In the event of heavy snowfall

Dry avalanches, whole day

**Moderate (2+)**

## Persistent weak layers

### Avalanche prone locations

### Danger description

The prevalence of the avalanche prone locations will increase with altitude. Dry avalanches can in some cases be released in near-surface layers. This applies in particular on very steep north facing slopes. Mostly avalanches are medium-sized. Ski touring calls for careful route selection.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

In the summer and autumn, avalanche bulletins are published only in the event of heavy snowfall. Even if the SLF does not publish an avalanche bulletin, due consideration is to be given to the avalanche situation especially if snow has fallen recently.

Wet-snow avalanches, as the day progresses

**Moderate (2)**

## Wet snow

Natural wet avalanches are possible, in particular medium-sized ones. The avalanche prone locations for wet avalanches are to be found in particular on west, north and east facing slopes below approximately 3000 m. Backcountry tours should be started early and concluded timely.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
