

Avalanche danger

Forecast through: 22.2.2025, 17:00 / Next update: 22.2.2025, 17:00

Wind slab, Persistent weak layers

Avalanche prone locations Danger description

Avalanches can be released in the old snowpack and reach quite a large size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. Avalanche prone locations are to be found in particular in little used backcountry terrain, especially on very steep north facing slopes. As a consequence of a moderate to strong southerly foehn wind, wind slabs will form. They are mostly shallow and can be released easily. Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can reach large size. Caution is to be exercised in areas with glide cracks.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
