## Wind slab

### Avalanche prone locations Danger description

Fresh and somewhat older wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls and generally in the high Alpine regions. These are only small but in some cases prone to triggering. They are to be evaluated with care and prudence in very steep terrain. Additionally in isolated cases avalanches can be released in the old snowpack and reach medium size. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
