

Avalanche danger

Forecast through: 30.4.2024, 17:00 / Next update: 30.4.2024, 17:00

Dry avalanches, whole day

Low (1)

No distinct avalanche problem

Dry avalanches can in isolated cases be released in near-surface layers of the snowpack. This applies in particular on very steep slopes. Avalanches can in isolated cases reach medium size. The prevalence of avalanche prone locations and likelihood of triggering will increase in the high Alpine regions. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Wet-snow avalanches, as the day progresses

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are possible as the day progresses. This applies in particular on steep sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Avalanches can reach medium size. More gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
