

# Avalanche danger

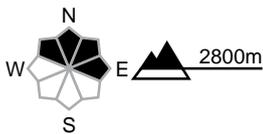

Forecast through: 5.5.2026, 17:00 / Next update: 5.5.2026, 17:00

**Moderate (2-)**

## Wind slab

### Avalanche prone locations **Danger description**

As a consequence of new snow and a moderate southerly wind, small wind slabs will form in particular in high Alpine regions. These are to be evaluated with care and prudence in very steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

**Moderate (2)**

## Wet snow

The surface of the snowpack will cool hardly at all during the overcast night. As a consequence of the precipitation wet avalanches are possible at any time. This applies in particular on steep north facing slopes between approximately 2200 and 2600 m. Mostly avalanches are medium-sized.

Danger levels

 1 low

 2 moderate

 3 considerable  4 high

 5 very high
