

Avalanche danger

Forecast through: 30.4.2024, 17:00 / Next update: 30.4.2024, 17:00

Dry avalanches, whole day

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are in some cases still prone to triggering. Single winter sport participants can release avalanches in some places, including medium-sized ones. The prevalence of avalanche prone locations and likelihood of triggering will increase in the high Alpine regions. Backcountry touring calls for meticulous route selection.

Wet-snow avalanches, as the day progresses

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are possible as the day progresses. This applies in particular on steep sunny slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. Avalanches can reach medium size. More gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
