

Avalanche danger

Forecast through: 21.11.2024, 17:00 / Next update: 21.11.2024, 17:00

Wind slab

Avalanche prone locations Danger description

As a consequence of new snow and a moderate to strong northwesterly wind, rather small wind slabs formed in particular in gullies and bowls. These are to be evaluated with care and prudence in particular in terrain where there is a danger of falling. The avalanches are small but in some cases easily released.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
