

# Avalanche danger

Forecast through: 1.4.2025, 17:00 / Next update: 1.4.2025, 08:00

**Moderate (2+)**

## Wind slab, Persistent weak layers

### Avalanche prone locations Danger description

Avalanches can be released in the weakly bonded old snow. They can reach medium size. These avalanche prone locations are difficult to recognise. Whumpung sounds can indicate the danger.

In addition the more recent wind slabs are prone to triggering in some cases. They are to be evaluated with care and prudence in steep terrain. In high Alpine regions these avalanche prone locations are to be found in all aspects.

Backcountry touring and other off-piste activities call for defensive route selection.

**Moderate (2)**

## Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and, in isolated cases, large wet and gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2600 m, as well as on steep shady slopes below approximately 2200 m.

Danger levels

 1 low

 2 moderate

 3 considerable  4 high

 5 very high
