

Avalanche danger

Forecast through: 7.6.2025, 17:00 / Next update: 7.6.2025, 17:00

Wind slab

Avalanche prone locations Danger description

Fresh and older wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls. They can be released by a single winter sport participant, but they will be small in most cases. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

The snowpack will be wet all the way through at high altitude. In particular on very steep north facing slopes individual medium-sized wet avalanches are possible as a consequence of the rain.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
